ABSTRACT

A method, apparatus, and system are provided for monitoring of system resources. According to one embodiment, a monitor server may be used to monitor system resources, to collect monitoring data associated with the resources, and to provide the monitoring data to a destination. The monitor server may include a Java Management Extensions (JMX)-based monitor server. Further, a managed bean server having a registry of managed beans may be coupled with the monitor server to facilitate the monitor server to monitor the resources.
